

The Bullet in Theara's Brain

Day by day we find in children forms of Tuberculosis outside of the lungs, often in the brain (Brain Tuberculoma). It is like a bullet in the brain. The diagnosis can only be done by modern and adequate facilities, by other words, only in children hospitalized in the Kantha Bopha Hospitals, where all treatment is free.

All these children would die without a correct treatment. And a correct treatment is only possible when there is a correct diagnosis. 2014 there are more severe TB forms in children, so more adults must be suffering from Tuberculosis and contaminating children in 2014, much more than being estimated.

There is no vaccination against Tuberculosis. The BCG vaccination is not effective. Why the Ministry of Health, WHO and Unicef are still doing it? This 10-year old boy (MRI pictures above) was vaccinated too as 95% of all severe Tuberculosis cases!

Dr. Beat Richner, head and founder of the Kantha Bopha Hospitals, 6.4.2014
